Welcome to

10. Honeypots

Communication and Network Security 2024

Henrik Kramselund he/him han/ham hlk@zencurity.com @kramse

Slides are available as PDF, kramse@Codeberg

10-Honeypots.tex in the repo security-courses

Goals for today

Todays goals:

- Talk about honeypots in general, but also how to get the right data for investigating
- We already used Elasticsearch and Kibana, spend a little time in Zeek data using the Filebeat import
- **Revisit earlier slides, documents, data, SELKS, Elasticsearch – get an overview**

Trying to make today less heavy with information, same next time with the Email subject.

Plan for today

Subjects

- History of honeypots
- Why use them research, production
- Types of honeypots low vs high interaction
- Honey nets
- Discuss visualisation and investigating incidents

Exercises

- Run SSH honeypot and try brute-force it
- Use Filebeat and investigate the options available from Zeek data

Reading Summary

ANSM chapter 11,12 - 54 pages

11. Anomaly-Based Detection with Statistical Data

12. Using Canary Honeypots for Detection

11. Anomaly-Based Detection with Statistical Data

Good advice found in the book:

- Top Talkers with SiLK
- Service Discovery with SiLK
- Furthering Detection with Statistics
- Visualizing Statistics with Gnuplot
- Visualizing Statistics with Google Charts
- Visualizing Statistics with Afterglow

Newer and other tools exist, but the process is the same.

Honeypot Definition

In computer terminology, a **honeypot** is a computer security mechanism set to detect, deflect, or, in some manner, counteract attempts at unauthorized use of information systems. Generally, a honeypot consists of data (for example, in a network site) that appears to be a legitimate part of the site, but is actually isolated and monitored, and that seems to contain information or a resource of value to attackers, who are then blocked.

Source: https://en.wikipedia.org/wiki/Honeypot_(computing)

also used as Honeynet - monitored network infrastructure

Often honeypots are:
- One of more systems that appear vulnerable
- One or more systems logging data about the attacks, network traffic, event logging etc.

The main goal is to lure attackers into the trap – any connection is suspicious

An Evening with Berferd

Abstract

On 7 January 1991 a cracker, believing he had discovered the famous sendmail DEBUG hole in our Internet gateway machine, attempted to obtain a copy of our password file. I sent him one.

For several months we led this cracker on a merry chase in order to trace his location and learn his techniques. This paper is a chronicle of the cracker's "successes" and disappointments, the bait and traps used to lure and detect him, and the chroot "Jail" we built to watch his activities.

*An Evening with Berferd In Which a Cracker is Lured, Endured, and Studied*, Bill Cheswick, AT&T Bell Laboratories, 1997 https://www.cheswick.com/ches/papers/berferd.pdf

The Honeynet Project
Source: Book *Honeypots: Tracking Hackers*, Lance Spitzner, 2003

Later came The Honeynet Project http://www.honeynet.org

Cuckoo's Egg 1986 A real spy story

Cuckoo's Egg: Tracking a Spy Through the Maze of Computer Espionage

Stoll created multiple files that looked interesting, so keep the attacker connected – over modem, so tracing could complete

During his time at working for KGB, Hess is estimated to have broken into 400 U.S. military computers

Book: Intrusion Detection Honeypots
Intrusion Detection Honeypots: Chris Sanders, Applied Network Defense, 2020, ISBN 9781735188300

- Easily read and fun
- Introduces the honeypot concepts nicely
- Uses cowrie honeypot software – often various forks exist of honeypot software
- Includes information about Honey Tokens, Honey Credentials etc.

ANSM 12. Using Canary Honeypots for Detection

Canary Honeypots

Types of Honeypots

Canary Honeypot Architecture

- Phase One: Identify Devices and Services to be Mimicked
- Phase Two: Determine Canary Honeypot Placement
- Phase Three: Develop Alerting and Logging

Honeypot Platforms

- Honeyd
- Kippo SSH HoneypotTom's Honeypot
- Honeydocs

Honeypots - ressourcekrævende?

"There are 69 separate departments at Georgia Tech with between 30,000-35,000 networked computers installed on campus."...
"In the six months that we have been running the Georgia Tech Honeynet **we have detected 16 compromised Georgia Tech systems on networks** other than our Honeynet. These compromises include automated worm type exploits as well as individual systems that have been targeted and compromised by hackers."

The Use of Honeynets to Detect Exploited Systems Across Large Enterprise Networks

Honeypots and IDS systems require ressources, but a combination might be more efficient

Kilde: https://staff.washington.edu/dittrich/pnw-honeynet/reading/gatech-honeynet.pdf

Honeypot High interaction and low interaction

High-interaction honeypots imitate the activities of the production systems that host a variety of services and, therefore, an attacker may be allowed a lot of services to waste their time. By employing virtual machines, multiple honeypots can be hosted on a single physical machine. Therefore, even if the honeypot is compromised, it can be restored more quickly. In general, high-interaction honeypots provide more security by being difficult to detect, but they are expensive to maintain. If virtual machines are not available, one physical computer must be maintained for each honeypot, which can be exorbitantly expensive. Example: Honeynet.

Low-interaction honeypots simulate only the services frequently requested by attackers. Since they consume relatively few resources, multiple virtual machines can easily be hosted on one physical system, the virtual systems have a short response time, and less code is required, reducing the complexity of the virtual system's security. Example: Honeyd.

Honeynets – Why use them research, production

Source: https://www.honeynet.org/
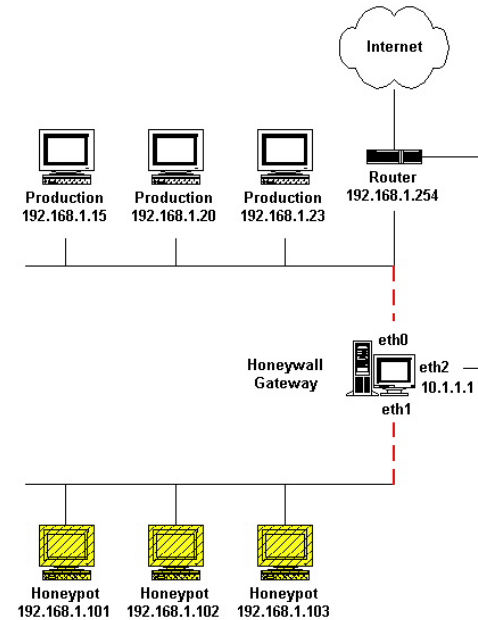

Creating a network architecture with multiple systems become a honeynet.

Lessons Learned from Honeynets in Universities

Out of all of this were a variety of lessons learned things to do and NOT to do. Hopefully this short list can help you avoid some common mistakes.

- Start Small - If you are going to install a honeynet within your enterprise, start small. Begin initially with two machines (in order to detect sweep scans of your honeynet) with operating systems that you are familiar with installed behind the reverse firewall.
- Maintain good relations with your enterprise administrators. THIS IS CRITICAL! Inform your network administrators of the types of exploits that you are seeing. In some cases, they will already be aware of these exploits, but in other cases, you will have been the first person to notice them.
- Focus on attacks and exploits originating from within your enterprise network. Theses are the attacks that can do the most damage to your enterprise. Inform your enterprise administrators immediately of these types of attacks since they indicate machines that have already been compromised within the enterprise.

Lessons Learned from Honeynets in Universities, cont

- Don't publish the IP address range of the honeynet. There is no need to do this. Hackers and worms are constantly scanning across the Internet for machines to exploit. You honeynet will be found and attacked.

- Don't underestimate the amount of time required to analyze the data collected from the honeynet. This data must be analyzed every day. You will be collecting lots of information and it must be analyzed to provide any benefit.

- Powerful machines are not necessary to establish the honeynet. The Georgia Tech Honeynet did not use state of the art machines and it functioned as intended. Everything we needed to establish our honeynet was already available on campus.

Honeypot vs NIDS

NIDS

- + See all traffic
- − see and need to process ALL TRAFFIC
- + Known and understood by management

Honeypot

- + See only attack traffic
- + Few false positives
- + Require less ressources

Selecting honeypot

We will work with a SSH honeypot, since our servers used in the labs are Debian

Searching for `ssh honeypot` show an example: Kippo, https://github.com/desaster/kippo, and this has a more recent fork: https://github.com/cowrie/cowrie

Very common - an open source tool exist, and reusing existing projects save time!

Maybe even try to get graphs from it using AfterGlow!
https://xn--blgg-hra.no/2017/01/how-to-produce-afterglow-diagrams-from-cowrie/

Exercise

Now lets do the exercise

🛈 **Fun with SSH honeypots 45min**

which is number **65** in the exercise PDF.

Security visualisation

We have talked about Kibana, but there are lots of other tools:

- graphviz, tulip, cytoscape, and gephi
- afterglow http://afterglow.sourceforge.net/
  https://xn--blgg-hra.no/2017/01/how-to-produce-afterglow-diagrams-from-cowrie/
- treemap
- mondrian, ggobi

More inspiration can be found on sites like: https://secviz.org/

A picture or graph often show more than just a table of data

SecViz - Security Visualization

Source: https://secviz.org/content/mapping-dns-with-graphviz.html

- Lets visit https://secviz.org/ Look into the Gallery

# Now we will revisit older stuff from the course

What data types do we use, need or want?

- Network logs, traffic logs, netflow?
- Which tools would you use, Elasticsearch why or why not?!

Focus on your own organisation, your skills, the need for skils, lets discuss the overall subject
Exercise

Now lets do the exercise

⚠ **Integrating Zeek IDS with the Elastic Stack 45min**

which is number **66** in the exercise PDF.

For Next Time

Think about the subjects from this time, write down questions

Check the plan for chapters to read in the books

Visit web sites and download papers if needed

Retry the exercises to get more confident using the tools
